We will be researching website security and vulnerabilities for our final project. We will be focusing on the main vulnerabilities, such as cross-site scripting, cross-site request forgery, and SQL injection. For each topic, we will go a bit deeper than in class. The plan is to focus on their exploitability (how easy or hard it is to exploit these vulnerabilities), detectability (how difficult it is to find if a website is vulnerable), and how dangerous it is (how much damage and impact it can cause). With danger, we will be trying to relate each vulnerability to STRIDE.
